DEVELOPMENT OF A CAR SALES WEBSITE FOR YONO MOBILINDO SHOWROOM USING LARAVEL

Scientific Paper. Informatics, Faculty of Industrial Technology, Gunadarma University, 2025

Keywords: Car Sales, Web Application, Showroom, Laravel, Informatics

(xvi + 141 + L-200)

Issues regarding the lack of transparency in vehicle condition information, the potential for fraud, and the limitations of conventional transactions in the used car market form the basis for developing a website-based solution for the Yono Mobilindo showroom. The objective of this system development is to provide a more satisfying experience for users and increase trust in the increasingly challenging used car market. The system was built using the System Development Life Cycle (SDLC) waterfall model, which includes the stages of requirements, design, implementation, testing, and maintenance. The developed website provides features such as vehicle search based on specific criteria, a buyer review system, car sales forms, and a Down Payment (DP) payment system integrated with Midtrans. Implementation utilized PHP, Bootstrap, Laravel, Figma, Xampp, MySQL, Visual Studio Code, and Midtrans to support the interface, data management, and payment integration. Testing was conducted using the Black Box method to ensure functionality meets user needs. The system successfully provides a transparent, efficient, and secure solution, thereby increasing trust between sellers and buyers while accelerating the vehicle buying and selling process. The website has been hosted and can be accessed via <https://yonomobilindo.online>.
